Product Management with Generative & Agentic AI
(BITSOM in collaboration with Masai)

14 April 2026

Introduction

In today's digital world, people rely heavily on online platforms like Google, mobile applications, and YouTube for health-related information.

However, a major challenge faced by many users is the difficulty in understanding complex English language used in these sources.

This problem is especially common in countries like India, where a large population is not fluent in English.

As a result, users struggle to understand important health information, which can lead to confusion, wrong decisions, and poor health outcomes.

This project focuses on identifying and analyzing this problem using real-world data and user feedback

PROBLEM STATEMENT

Many users in India face difficulty understanding important health-related information due to complex English language used in apps, websites, and videos.

This creates confusion, misinterpretation, and prevents users from taking correct actions related to their health.

The problem is more serious for non-English speakers and beginners who rely on digital platforms for medical guidance.

WHY THIS PROBLEM IS **IMPORTANT**

This problem affects a large population in India where many users are not fluent in English.

Due to complex language, users fail to understand treatments, instructions, and medical advice properly.

This can lead to wrong decisions, delayed treatment, and poor health outcomes. Therefore, solving this problem can improve accessibility, user experience, and overall well-being.

TARGET USERS

The target users for this solution are:

- *Non-English speakers*
- *People from rural and semi-urban areas*
- *Beginners using health apps*
- *Elderly people who are not comfortable with English*
- *Users who prefer simple and easy-to-understand language*

COMPETITION

Current competitors include:

- *Health apps like Practo, HealthifyMe*
- *Google search results*
- *YouTube health videos*

However, these platforms mostly use complex English and do not provide simplified explanations, which creates a gap in user understanding.

CVP (Customer Value Proposition)

Our solution will provide simplified and easy-to-understand health information in user-friendly language.

It will focus on clarity, personalization, and accessibility so that users can clearly understand their health problems and solutions without confusion.

VALUE PROPOSITION CANVAS

Customer Pain:

Difficulty understanding complex English

Confusion in medical terms

Lack of clear explanations

Customer Gain:

Easy language

Clear understanding

Better decision making

Product Value:

Simple explanations

Multi-language support

User-friendly interface

WHY WILL CUSTOMERS **SWITCH**

Customers will switch because the solution provides clear, simple, and understandable information compared to existing platforms.

It reduces confusion and builds trust by focusing on user needs and language simplicity.

UNIT OF SALE

The unit of sale can be subscription-based access to premium features such as advanced explanations, personalized guidance, and additional language support.

REVENUE MODEL

- *Freemium model (basic free + premium paid features)*
- *Subscription plans*
- *Ads revenue*
- *Partnerships with healthcare platforms*

DEMAND FORECASTING

Demand can be forecasted based on:

- *Increasing number of internet users in India*
- *Growing demand for digital health solutions*
- *User feedback and app usage data*

COST STRUCTURE

- *App development cost*
- *Maintenance and updates*
- *Marketing cost*
- *Customer support*
- *Content creation*

KEY METRICS

- *User engagement*
- *Retention rate*
- *Number of active users*
- *Customer satisfaction*
- *Conversion rate (free to paid)*

EXPERIMENTAL

SECTION

(Problem Signals & Analysis)

Experimental Intro

To validate the problem, real-world problem signals were collected from different platforms such as Google Search, YouTube, and mobile applications.

These signals highlight the challenges faced by users due to complex English language in health-related information.

A total of 10 problem signals have been identified and analyzed below.

Problem Signal 1

Source: Youtube

<https://youtu.be/LwOy5lvqjXQ?si=cJ2JyTRhHbdBBMRz>

Observation:

Health-related videos use fast-paced English explanations with advanced vocabulary

Explanation:

The fast speed and complex language make it difficult for non-English speakers to understand the content.

Insight:

Complex English creates a barrier to understanding health information.

Problem Signal 2

Source: Youtube

<https://youtu.be/Zt6WaTBnj7E?si=MxAlWRg3XsnFwXe3>

Observation:

Users need to rely on subtitles to understand video content

Explanation:

Subtitles may help to some extent, but if the language itself is complex, they do not fully solve the problem. Many users still struggle to interpret the meaning

Insight:

There is a need for simplified and translated subtitles

Problem Signal 3

Source: Youtube

<https://youtu.be/U3HSHp8z3AQ?si=X541E4HQ-MYYOsgyagraph text>

Observation:

Medical explanations in videos include technical terminology and detailed processes

Explanation:

The use of medical jargon makes it difficult for users to understand the core message. Instead of simplifying the information, videos often add more complexity

Insight:

Technical explanations limit accessibility for general users

Problem Signal 4

Source:Google search

Observation:

Search results for liver treatment and weight gain problems contain long explanations and advanced English terminology

Explanation:

The content is often lengthy and filled with unfamiliar words, making it hard for users to quickly grasp the key information. Users who are not comfortable with English may feel overwhelmed and may not fully understand the advice provided

Insight:

Lengthy and complex information reduces accessibility for non-English users

Problem Signal 5

Source: Google search

Observation:

Search results related to high and low blood pressure use terms like hypertension, systolic and diastolic pressure

Explanation:

These terms are not commonly understood by the general population, especially in rural or underserved communities. Even though blood pressure issues are widespread, the use of complex English makes it difficult for users to understand their condition and possible treatments

Insight:

Complex medical vocabulary creates a barrier to understanding critical health information

Problem Signal 6

Source: Google search

Observation:

Search results for diabetes treatment include complex medical terminology such as insulin therapy, glucose levels, and advanced treatment methods

Explanation:

The information presented is highly technical and assumes that users already have a basic understanding of medical terms. For a general user, especially someone who is not fluent in English, it becomes difficult to interpret such detailed explanations. This is problematic because diabetes is a very common health issue, yet the information is not accessible to all

Insight:

This indicates that even widely searched health topics are not presented in a user-friendly and understandable manner for non-English speakers

Problem Signal 7

Source: Google Play Store – [Tata 1mg_Reviews](#)

Observation:

User is confused about delivery status and repeatedly needs to check updates. The information shown in the app is not clearly understood.

Explanation:

This indicates that the app's language and communication style are not simple or clear enough for all users. Complex English terms and unclear messaging create confusion about order status.

Insight:

Users need simple, easy-to-understand language (local language support) to clearly understand app updates and actions.

Problem Signal 8

Source: *Google Play Store – [Disha Ai Health Coach](#) Reviews*

Observation: *User is unable to understand what is happening with payment (debited but failed message). The situation creates confusion and panic.*

Explanation: *The app likely uses technical or English-heavy error messages that are not easily understood by all users. Lack of clear explanation in simple language increases user anxiety.*

Insight: *Apps must provide clear, simple, and local-language explanations for important actions like payments to avoid confusion.*

Problem Signal 9

Source: *GooglePlayStore – Google Fit Reviews*

Observation:

Userstrugglesto understand how step tracking works and why numbers are changing. The behavior of the app is confusing.

Explanation:

Theappdoes not clearly explain how tracking works or why inconsistencies happen. Complex or missing explanations make it difficult for users to trust and understand the system.

Insight:

Usersneedsimple explanations and guidance in easy language to understand how features work.

Problem Signal 10

Source: [GooglePlayStore](#) – [Google Fit Reviews](#)

Observation:

User feels demotivated because the app shows inconsistent running data (distance changes automatically). The user is unable to understand why the data changed.

Explanation:

The app does not provide clear and simple explanations for changes in activity data. Complex or missing communication (likely in English) makes it difficult for users to understand what is happening.

Insight:

Users need clear, simple, and understandable explanations (preferably in local language) for data changes to maintain trust and motivation.

Thank You

Thank you for reviewing this project.
